4.0 after installation care 13
1.0 before you start

Your new B&D Roll-A-Door® has been designed to provide security, attractive appearance and smooth, low effort operation. Your door will not provide optimum performance unless it is installed correctly. For satisfactory door operation please follow the instructions carefully.

NOTE: No guarantee will be given or responsibility accepted by the manufacturers if the door is not installed as instructed.

1.1 safety checklist

The following hazards and hazard controls have been identified for installers during the installation of this door.

<table>
<thead>
<tr>
<th>hazard</th>
<th>control</th>
</tr>
</thead>
<tbody>
<tr>
<td>• Housekeeping - risk of slip trip or fall</td>
<td>• Tidy up site prior to start work as a minimum area should be at least</td>

</tbody>
</table>
1.2  Substrate fastener recommendations (refer to the DTCM web site)

**Important information on fasteners**

Coach bolts/screws supplied with this product are NOT suitable for windrated doors. The installer must select and use fasteners appropriate to the material into which they are being fixed. REFER TO THE DTCM DRAWINGS

1.3  Requirements before installation

**Opening requirements**

The door is designed to be mounted behind the opening.

**Opening width** - As the door overlaps each side by 55mm or more, the door should be 110mm wider than the opening. A wider door can be fitted as long as additional sideroom and fixing is available. Refer to the compliance page of these instructions.

**Opening height** - The door will fit any opening height up to the marked door size. The walk under height will be 80mm less than the marked door height. For lower openings the guides can be cut to suit from the bottom.

**Level and plumb** - The door must be installed in an absolutely level position, if opening is not level and square, appearance and/or sideroom requirements will be affected. The floor should be level or recessed across the opening to avoid gaps.

**Structural suitability** - Ensure the structure conforms to the structure drawings shown on the DTCM website (refer to the compliance page of these instructions). If unsure, consult a builder.

**Sideroom** - A minimum of 100mm (135mm desirable) of sideroom is required behind the opening and should extend above the head to allow for bracket fixing. Sideroom on one side of minimum 140mm recommended, 190mm is required if a B&D Controll-A-Door® garage door opener is to be fitted now or in the future.

**Obstructions** - Ensure that the surface where the door will be fitted is flush and smooth, and the area behind the opening is free from any protrusions.

**Headroom** - See diagram. If the door is installed lower into the opening than shown, additional loss of walk-in clearance will result.

**NOTE:** Restricted headroom is NOT recommended for windlocked or doors fitted with an opener.
1.4 fixing requirements

The installer must select and use fasteners appropriate to the material into which they are being fixed. Refer to the instructions shown on the DTCM website (refer to the compliance page of these instructions).

**NOTE:** It is the installer’s responsibility to ensure that the fixing methods are sound.

1.5 tools

It is recommended that this door is installed by a professorial door installer using a professional and specialized tool kit.

1.6 parts checklist

A. 1 - rolled, plastic wrapped door
B. 2 - “A” style brackets, left and right handed
C. 2 - door guides, left and right handed (aluminium)
D. 2 - locking bars (steel)

**1 small parts bag containing:**

E. 1 - door handle and fixings to suit
F. 2 - metal stops
G. 1 - faceplate and lock assembly 2 - keys
H. 2 - locking bar retainer
I. 2 - locking bar covers
J. 2 - “U” bolts
K. 2 - axle/bracket saddles
L. 4 - 8mm nuts and washer for “U” bolts
M. 2 - counter sunk screws for handle
N. 2 - 7mm x 4mm mushroom head screws
O. 2 - 4mm x 6mm locking bar screws
P. 4 - washers
2.0 installation

2.1 install first bracket

a) **Measure the door** curtain width and mark where edge of the curtain will be, allowing for overlap on each side of the opening.

b) **Add clearance** of 35 to 75mm from edge of curtain to inside edge of bracket to determine positioning of the bracket. Also check this clearance if an opener is being fitted.

c) **Normal Headroom** (350mm for doors up to 2200mm high, 370mm for doors over 2200mm high). Measure up 120mm from underside of the head. If the head is not level, measure up from the lowest side first.

   **Restricted Headroom** (315mm for doors up to 2200mm high, 335mm for doors over 2200mm high). Measure down 230mm (or 250mm if door is over 2200mm high) from roof or lowest obstruction to the top of the bracket. (Bracket should be between 85mm and 100mm up from the lintel).

   **NOTE:** Restricted headroom is not recommended for doors fitted with an opener.

d) Mark two hole positions using top and bottom slots of the bracket.

e) Drill both holes, then attach bracket using 2x100xM10 Anchor screws or equivalent or three 22mm 14-20 Tek screws to each bracket. Ensure large diameter washers are used.

2.2 install second bracket

a) Using a water level mark the position for the second bracket.

   **NOTE:** The brackets must be perfectly level for the door to operate.

b) Re-check levels then drill and fix as with first bracket.
2.3 place door on brackets

a) Check the axle length and cut if sideroom is limited. Before cutting, make sure the floating axle is free and centred. Centre will be found by rotating the axle a quarter turn in either direction then releasing. With centre found, make a clear mark on the axle against the hub for later reference.

b) Lift door onto the brackets (the right way round so that the door will roll down from the front of the opening). Immediately loosely fit the “U” bolts, saddles, washers and nuts to the brackets in position shown. Fitting the “U” bolts eliminates the door falling from the brackets. (Do not tighten until Step 2.4, c)

2.4 position door

a) Centre the door with the opening, while ensuring the floating axle is also centred with the door. Do this by lining up previous marks with the hub, then lift both the axle and the door together until it is centred with the opening.

b) Rotate the curtain and axle so that the bottom rail of the door is positioned as shown (three o’clock).

c) Push the axle forward in the slots (toward the opening) and tighten the nuts firmly without overtightening. (10 Newton metres or 6.6 feet/pounds torque reading).

NOTE: Do not cut the plastic wrap or packaging yet.
2.5  tension the springs

FIRST PREPARE A SOFT WOOD CHOCK, ABOUT 400mm LONG.

THEN - Ensure that bottom rail is at the 3 o’clock position as shown in Step 2.4.

a) Ensure both “U” bolts are tightened, then -
   1. Rotate the door 1½ turns in a forward direction to apply tension. Do not let go as the springs are now tensioned. See arrow in Fig (a).
   2. Hold the door firmly, NOW cut the plastic wrap along the bottom rail (taking care not to damage door surface or weatherseal).

b) Pull the curtain down slowly and carefully position the wooden chock (or other appropriate stop) as shown in Fig (b). Take care not to damage door surface.

The chock will help hold the door until the guides and stops are fitted.

2.6  notching bottom rail (if required)

2.7  attaching stop

To attach metal stops to bottom rail of door.

a) Hook stop behind lip in rail, as shown.

b) Secure from underneath the rail with screws supplied. You will need to trim the weatherseal flush with the end of the bottom rail.
2.8 guides

a) Check that curtain overlaps equally on both sides.

b) Check that guides are the correct length, that is, level with the brackets (or in the restricted headroom position are 35mm maximum above bracket). **NOTE: Restricted headroom is not recommended for doors fitted with an opener.**

c) Allow 0mm clearance between the inside of the guide and plastic Roll-A-Guide. **NOTE:** Do not reshape the guide lead in or cut unless it is damaged.

d) Ensure the guide is plumb and the clearance is correct. Fix to the structure using the specified fixings on the DTCM drawings (refer to the compliance page of these instructions). Temporarily fix the top and bottom of the guide.

e) With the top of the 2nd guide level with the first, repeat (c) and (d).

f) Remove the chock and slowly lower the door removing plastic wrap as you pull door down, reposition the guides as necessary to allow smooth and even operation with >0mm clearance throughout.

g) Ensure door curtain enters guides smoothly. ENSURE the door operates correctly BEFORE finalising the guide fixings.

2.9 fitting handle

Fit the handle to the outside of the door using the screws, nuts and washers provided.
2.10 centre lift lock

a) Raise the curtain until the lock corrugation is visible above the door guides.

b) Install locking bar retainer in line with lock corrugation by pushing retainer towards door edge, sliding the legs under the Nylofelt® and hooking them over the curtain edge (it is easier to hook legs one at a time). Ensure lock bar retainers sit squarely on door curtain. See Fig (b).

c) Fit faceplate to outside of door where the hook will latch onto curtain edge, then slide faceplate as far to the right as possible. Use adhesive tape on outside to hold in position.

d) Attach the lock body to the faceplate from the inside, using the mounting screws and washers. Do not over tighten the screws. See Fig (d).

e) With the door in the closed position slide the end of the locking bars through the locking bar retainers, and while holding the bars level mark the side of the guides.

f) Drill and file out a rectangular slot no longer than 25mm and no wider than 10mm. Ensure top of slot remains in line with top of locking bar.

g) Slide bars through the guide slot, then back onto lock arms. Screw on securely using the 4mm x 6mm screws supplied. Ensure that locking bars do not protrude more than 20mm beyond guide when engaged in locked position. It may be necessary to adjust the length of the bars.

h) Ensure a clean and dry guide surface. Wipe guide with clean rag.

i) Peel off lining from lock bar cover and position over hole. Check that the movement of the locking bar is free.

NOTE: The fitting of the lock bar covers is important to prevent possible finger entrapment - particularly important when the door is fitted with an automatic garage door opener.
2.11 final adjustment

1. If the door is hard to operate in **ANY DIRECTION** check that the door is not jamming in the guides.
   
   **Check:**
   
   a) the guide clearances;
   
   b) that guides are plumb;
   
   c) that the guide surfaces are clean and free from oil;
   
   d) that locking bars are the correct length; and
   
   e) that weatherseal is correct length.

2. If the door is hard to operate in **ONE DIRECTION**, the spring tension requires adjustment. See 2.11.
   
   a) If the door is hard to lift, but tends to drop, then increase the spring tension.
   
   b) If the door is hard to close, but tends to rise, then decrease the spring tension.

3. If the door rolls up crooked as shown right then:
   
   **Check:**
   
   a) Brackets are level, refer to Step 2.2.
   
   b) Axle is centralised.
   
   c) Guides are plumb, refer to Step 2.9.

To centralise the axle - **NOTE:** these instructions are for the example illustrated - the axle needs moving to the right (to move left they would be vice versa). **NOTE:** Springs are tensioned and can cause injury.

With the door rolled up tie two ropes around the door roll approximately 300mm from each end, as a safety precaution. With the door rolled up, loosen one “U” bolt, then go to the other end of the door and with a firm hold on the axle, with a pipe wrench, loosen the second “U” bolt and move the axle to the right (the direction of the arrow in diagram). Move the door distance “X” in diagram. **Re-tighten** one of the “U” bolts before releasing pipe wrench then **re-tighten** the other “U” bolt.

If the door is stiff to work or rattles over lead-in on top of guide, then refer to Step 2.4.

2.12 to adjust spring tension

(follow carefully)

1. With the door rolled up tie two ropes around the door roll approximately 300mm from each end, as a safety precaution.

2. With a person at each end of the door, hold the axle firmly with a large pipe wrench (Stillson) at least 450mm long.

3. Loosen the “U” bolt nuts at both ends and **KEEP A FIRM GRIP ON WRENCH**.

4. Rotate the axle in the required direction (see diagram).

5. Re-tighten the “U” bolts **BEFORE** releasing pipe wrench.

6. Test and repeat if further adjustment is necessary.
2.13 fixing alternatives

1. alternative bracket fitting

An "A2" extended leg bracket should be used in conjunction with the standard "A" style bracket.

3.0 compliance

PLEASE ENSURE YOU ARE COMPLYING TO THE LATEST DETAILS

We have also been granted DTCM certification for the below B&D products in accordance with the National Construction Code. To download the latest DTCM drawings visit their product page on our website www.bnd.com.au where you will be directed to the DTCM website.

Series 1 (R1D, R1F, R1R, R1M, R1ME)
Series 2 (R2I, R2W, R2F)
Windpanel Tracklock (WTG 2, 3, 4)
Roll-A-Shutter (6/100, 8/100, 10/100, 12/100)

The NT Deemed To Comply Manual (DTCM) is referenced in the Building Code of Australia.
4.0 after installation care

general care of your Roll-A-Door®

cleaning

**BLUESCOPE COLORBOND® FINISH**

Your B&D Roll-A-Door® door has been pre-painted with a silicone modified polyester formulation, which is one of the best paint films commercially available today. However, all exposed surfaces require some attention to guard against the premature onset of corrosion and any other harmful atmospheric effects. In our atmosphere there are harmful deposits that gather on the door surface and if not removed regularly, will seriously affect the appearance and life of the door.

Washing of the door with clean water and a cloth every 14 days is recommended – particular care should be taken to clean areas of the door not normally washed by rain, including the top of the door roll inside the garage.

**NOTE:** In locations where there is likely to be salt in the air or industrial fallout is severe, more frequent washing is required. In extreme environments or frequent use, the door should be washed every 7 days.

Touch-up paint, if required, is available from your B&D dealer.

lock

Your lock does not require special maintenance, however, if the keyway becomes stiff, the application of powdered graphite is recommended – do not grease or oil the lock.

The faceplate should be washed with soapy water and rinsed well. Strong solvents, such as acetone, should not be used – these will damage the surface. **WARNING!** Do not disassemble the lock mechanism.

When opening the door, always make sure the key is with drawn from the lock – if this is not done, the lock mechanism could be damaged and the key bent or broken.

We suggest you record your full Key letter and Number on the front of this manual and if replacement keys are required they can be obtained from your nearest B&D office, simply by quoting this number. If the keys have been lost and the number not recorded, it can be found stamped into the locking arm at the back of the mechanism.

**NYLOFELT®**

On no account should you use grease or oil in the door guides or on the Nylofelt® running strips – the grease or oil will clog the Nylofelt® and spoil the operation of the door. An occasional wipe with a cloth dampened with mineral turps or methylated spirits, down the inside of each guide, is very beneficial in removing any trace of grease or dirt.

After the guides have been cleaned, a silicon spray may be used in the guides.

**NOTE:** WD40 or similar oil based sprays are not silicon and should not be used.

Care should be taken not to damage the Nylofelt®, however, if Nylofelt® is cut or damaged, a lighted match should be used to quickly seal the ends of the nylon braiding, so as to stop any further deterioration.

regular maintenance required

B&D recommends that you check the operation of your Roll-A-Door® at least every six months (more regularly in extreme environments or frequent use). The effort required to manually open and to manually close the door should be about the same (if door has an automatic opener, put into manual mode before testing door). If the door is difficult to operate in either direction (up or down) then check:

1) that the Nylofelt® running strips on each side of the door have not slipped from the edge and are jamming the door;

2) that the door is running correctly in the guides and the guides are straight and perpendicular; and

3) that the inside surfaces of the guides are clean and free of obstructions. (see paragraph on care of Nylofelt®)

If you have checked these (and corrected where necessary) and the door is still difficult to operate, then your door will need a service to adjust the spring tension and possibly other operational parts of the door. This service should only be carried out by an experienced door technician, using the correct tools.

If you have an automatic opener fitted to your door, it is particularly important that you ensure the optimum operation of the door, otherwise you may reduce the effective life of the opener.

To keep your door running well, it is recommended that your door be serviced, by an experienced door technician, every 12 months (more regularly in extreme environments or frequent use), or earlier if required.

spring tension

It is natural for springs to lose tension over time. When spring tension is adjusted or when your door is first installed it is usual to apply a little more tension than is required for balanced operation, to allow for the normal “settling in” of the springs.

warranty

The B&D Roll-A-Door® in normal residential use is covered by a 7 year warranty on door curtain, 12 months on surface (excludes salt corrosion), all other parts 12 months, including lock. For industrial/commercial applications the door is covered by 12 month warranty.

Warranty conditional on proper care as recommended above. Full details of the warranty are available from your nearest B&D office or visit the B&D website www.bnd.com.au
